4x40 Serial LCD Module (BPP-440) v4.0

The BPP-440 is an LCD module with attached serial interface. This combination works like a simple serial-receive terminal at 1200 to 9600 baud (switch selectable). Common control codes like carriage returns, linefeeds, tabs, backspace, etc. are supported. The display also implements instructions for cursor positioning, backlight control, large-character display, and right-aligned printing.

New Features in Rev 4.0. This latest version of BPP-440 has the following new features:

• Ability to redefine custom, block-graphics characters.
• Jumper pads to increase backlight brightness or set backlight always on.
• 64-byte buffer, large alpha (A-Z) characters, right-alignment (introduced in rev 3.0)

The revision is identified by “BPP4/PT” printed in the lower right portion of the serial daughterboard.

Disclaimer of Liability

Scott Edwards Electronics, Inc. is not responsible for any special, incidental, or consequential damages resulting from any breach of warranty, or under any legal theory, including lost profits, downtime, goodwill, damage to or replacement of equipment or property, and any costs or recovering, reprogramming, or reproducing of data associated with the use of the hardware or software described herein.

Warranty

Scott Edwards Electronics, Inc. warrants this product against defects in materials and workmanship for a period of 90 days. If you discover a defect, we will, at our option, repair, replace, or refund the purchase price. Return the product with a description of the problem. We will return your product or its replacement via standard shipping. Expedited shipping is available at the customer’s expense.

• Note: Abusing the module, or attempting to repair or modify it, voids this warranty.

Trademarks and Copyrights

LCD Serial Backpack® is a registered trademark of Scott Edwards Electronics, Inc.; BASIC Stamp® is a registered trademark of Parallax Inc. All trademarked names referenced herein are the property of their respective holders. This manual in its entirety is copyright Scott Edwards Electronics, Inc., 1994—2000.
Pinout of the BPP-440

Connections to the BPP-440 are made through a 5-pin header on the serial interface daughterboard, as shown in figure 1 below.

![Figure 1. Connections and controls.](image)

**Configuration**

With power removed, set the switches of S1 to the desired baud rate as shown in figure 1. Up is on.

**NOTE:** The BPP-440 reads the switches only at startup. Change settings only with the power off.

**Hookup for Use**

Figures 1 and 2 show how to connect serial I/O and power to the BPP-440. Make sure that the power polarity is correct. Reversing +5 and GND will damage the BPP-440 and possibly your power supply. The power source should be regulated to 5 volts ±0.25 volts and be capable of supplying 100mA (maximum current draw with the LED backlight on).

J1, the 5-pin connector, has two extra pins for +5 and GND. These pins are arranged in a *palindrome* layout. If you make a matching 5-pin connector, the connections will always line up properly regardless of connector orientation. Suitable female crimp sockets for making connectors are available from Jameco (www.jameco.com, PN: 100765). Digi-Key carries ready-made 5-pin socket and flex-cable assemblies in varying lengths (www.digikey.com; example part no.: A9BAG-0506F-ND).

**Do not reverse +5V and GND, even momentarily.** Reversed power will destroy the electronics.

**Do not exceed 5.5V into +5.** Overvoltage will damage the module.

**Connect power only through J1.** Connecting power to other points on the module will damage it.

**Read and follow installation guidelines on page 10.** Improper handling voids the warranty.
Piezo Buzzer “Bell”

As figure 1 shows, you can connect a piezo buzzer to the BPP-440. The buzzer will beep when the ASCII bell character (cntl-G) is received. The buzzer must have an internal oscillator and work on 5V at 25mA or less. Suitable units are Jameco 76021, Radio Shack 273-065, and Digi-Key P9948. Connecting anything other than a suitable buzzer to J4 will void the warranty.

Backlight Option Pads (BRIGHT and BL_ON)

Pads marked BRIGHT and BL_ON customize the operation of the LED backlight. Soldering a wire across the pads marked BRIGHT changes the current-limiting resistance in the backlight circuit from 16Ω to 8Ω, increasing the brightness of the light. This increases max current draw to about 150mA.

Soldering a wire across the pads marked BL_ON connects the backlight directly to the module’s power input so that whenever the unit is powered up the backlight is on.

Do not attempt these modifications unless you are skilled at soldering. Damage due to poor soldering is not covered by warranty.

Basic Operation

Set the configuration and connect serial input/power to the BPP-440 as shown in the previous sections.

Now you can send text serially to the display. On a PC, you may use a terminal program (such as the Windows Terminal or Hyperterminal accessory, or Procomm for DOS). Set it for the appropriate baud rate (matching switch 2). In addition to the baud rate, the terminal should be set for:

- no parity
- 8 data bits
- 1 stop bit
- flow control = none
- local echo = on

Control Codes and Special Features

Table 1 lists the BPP-440 control codes. To send control codes from a terminal program, hold down Control and press another key. For example, to send cntl-E (underline cursor) hold down Control and press E. To send control codes from a program, send the ASCII value as a single byte (not as a text representation of the number). Using cntl-E as an example, send a single byte containing the value 5 (00000101 binary). Control codes not listed in the table are ignored by the BPP-440 and have no effect.

</tbody>
</table>

*NOTE: New (rev 4.0) custom-character instructions (ESC-D and ESC-E) begin with the Escape character; see listings under Escape at the end of this section.

Null (control-@, ASCII 0)

Nulls are ignored; sending a null to the display has no effect. However, unlike other unused codes, nulls are not even stored in the display buffer. They may be used as a brief time delay whose length depends on the baud rate: 1200 bps = 8.32 ms delay; 2400 bps = 4.16 ms; 4800 bps = 2.08 ms; 9600 bps = 1.04 ms.

Cursor Home (control-A, ASCII 1)

Move the cursor to the first character position of the first line.

Begin Big-character Display (control-B, ASCII 2)

Put the display into big-character display mode. In this mode, characters are displayed as four-line-tall graphics. The display can show up to eight big characters at a time. The big character set includes numbers 0-9, letters A-Z (uppercase only), and symbols period (.), hyphen (-), colon (:), and space. The display remains in big-character mode until it receives a character other than the ones listed, or a control-C. Note that null (ASCII 0) will not end big-character mode because it is discarded before being buffered.

The numbers and letters are four columns wide followed by one blank column; punctuation and spaces are two columns followed by one blank column.

Tips for using big characters: Give the display approximately 10 ms to ‘draw’ the characters. If you have used ESC-D to redefine any of the custom characters, send ESC-E 1 to reset them to defaults before displaying large characters.

End Big-character Display (control-C, ASCII 3)

End big-character mode without otherwise affecting the display.

Hide Cursor (control-D, ASCII 4)

Hide the cursor (either type, blinking or underline).

Show Underline Cursor (control-E, ASCII 5)

Show a non-blinking underline cursor at the printing location.

Show Blinking-Block Cursor (control-F, ASCII 6)

Show a blinking block cursor at the printing location.
Bell (control-G, ASCII 7)
- Pulse J4 for approximately 100 ms to beep piezo buzzer.

Backspace (control-H or backspace key, ASCII 8)
- Move the cursor back one space and erase the character in that space.

Horizontal Tab (control-I or Tab key, ASCII 9)
- Move the cursor forward to next multiple-of-four column.

Smart Linefeed (control-J, ASCII 10)
- Move cursor down one line. If immediately preceded by carriage return, linefeed is ignored.

Vertical Tab (control-K, ASCII 11)
- Move cursor up one line.

Clear Screen (control-L, ASCII 12)
- Clear the screen, leaving the cursor in position 0 (see figure 3).

Carriage Return (control-M, ASCII 13)
- Move the cursor to the first position of the next line.

Backlight ON (control-N, ASCII 14)
- Turn on the LED backlight.

Backlight OFF (control-O, ASCII 15)
- Turn off the LED backlight.

Position Cursor (control-P, ASCII 16)
- Accept a number (0 to 159) and move the cursor to that position (where 0 is the 1st character of the 1st line and 159 is the last character of the 4th line; see figure 3). Number may be in text or single-byte format:
  - **Text method:** Send the desired display position as a printable text. For example, to move the cursor to position 21 (2nd character, 2nd line) from a terminal program, press control-P and type “21” followed by a space or other character (which will be discarded).
  - **One-byte method:** Send the display position as a single-byte value equal to the position plus 64. For example, to move to position 21 you would send control-P (ASCII 16) followed by ASCII 85 (21 + 64).

Clear Column (control-Q, ASCII 17)
- Clear the current column and advance the cursor to the next column, same line. This feature can be used to clear a four-line-high section of the screen.

---

**Figure 3. Layout of the 4x40 LCD**

---

Scott Edwards Electronics, Inc. 2160 E. Fry Blvd, Ste C5 #506, Sierra Vista, AZ 85635 USA ph: 520-459-4802 • fax: 520-459-0623 • www.seetron.com
Right-align Text (control-R, ASCII 18)

Accept a number from 2 to 9 (as text) representing the width of an area on the screen in which right-aligned text is to be printed. Cursor will back up that number of characters from present cursor position. Subsequent text will be stored without printing to the screen until one of the following is received:

- The specified number of characters.
- A control character (ASCII 1—31).
- A decimal point [the period (.) character, ASCII 46].

The display will print the text with right alignment and erase any leftover text within the specified width.

For example, move the cursor to the right end of the screen, send control-R (ASCII 18), followed by “5.”

Escape Sequences (control-[, ASCII 27, followed by additional parameters)

BPP-440 understands two instructions that begin with the escape code (ASCII 27).

- Define a Custom Character (ESC D n B0 B1 B2 B3 B4 B5 B6 B7)

The BPP-420 has eight custom-character slots. These characters are mapped to ASCII codes 128 through 135. At startup, the unit loads bitmaps into these slots for the big-character (cntl-B) mode. Using the Define instruction, you can change a bitmap. Send Escape (ASCII 27) followed by the letter D (ASCII 68), then the symbol number you wish to define (0—7, ASCII 48—55), followed by eight bytes defining the bitmap. The contents of those bytes map to the custom character as shown in figure 4.

NOTE: If you redefine any of the custom characters, you must restore them using ESC E before using big-character mode.

- Restore Default Custom Characters (ESC E 1)

The big-character mode (cntl-B) builds 4-line-high characters using the custom-character bitmaps (ASCII 128 —135). If you use ESC D to redefine one or more of these characters, big characters won’t display correctly. To restore the bitmaps needed for custom characters, use ESC E 1. That is, send ASCII 27 (ESC), ASCII 69 (E), and ASCII 49 (1).

Escape Sequences (control-[, ASCII 27, followed by additional parameters)

BPP-440 understands two instructions that begin with the escape code (ASCII 27).

- Define a Custom Character (ESC D n B0 B1 B2 B3 B4 B5 B6 B7)

The BPP-420 has eight custom-character slots. These characters are mapped to ASCII codes 128 through 135. At startup, the unit loads bitmaps into these slots for the big-character (cntl-B) mode. Using the Define instruction, you can change a bitmap. Send Escape (ASCII 27) followed by the letter D (ASCII 68), then the symbol number you wish to define (0—7, ASCII 48—55), followed by eight bytes defining the bitmap. The contents of those bytes map to the custom character as shown in figure 4.

NOTE: If you redefine any of the custom characters, you must restore them using ESC E before using big-character mode.

- Restore Default Custom Characters (ESC E 1)

The big-character mode (cntl-B) builds 4-line-high characters using the custom-character bitmaps (ASCII 128 —135). If you use ESC D to redefine one or more of these characters, big characters won’t display correctly. To restore the bitmaps needed for custom characters, use ESC E 1. That is, send ASCII 27 (ESC), ASCII 69 (E), and ASCII 49 (1).

To find the ASCII code for a given character, add the row and column numbers. For example, capital D is in the column marked 64 in row 4, so its ASCII code is 68. Use the reverse procedure to determine the symbol for a given code. For example, ASCII code 244 produces the symbol Ω, found at column 240, row 4.
Program Examples

Any computer/programming language that can produce serial output (1200-9600 bps, N81) can talk to the BPP-440. The examples here are in BASIC, chosen because of its popularity and readability.

You may download these and other program listings from seetron.com.

' Program: 440DEMO.BAS (Demonstrate 4x40 Serial LCD with BASIC Stamp I)
' This program demonstrates many of the features of the 4x40 Serial
' LCD Module from Scott Edwards Electronics, Inc. Set the module to
' 2400 bps (S1: left switch down, right switch up). Connect the serial
' input of the module to Stamp pin 0, GND to GND and +5V to +5V.
' Run this program.

Important Notes on Handling, Installation, and Mounting

LCDs are precision-made electro-optical devices that should last a lifetime of normal use. They are vulnerable to damage from mishandling, however. Our warranty excludes damage from abuse, so it is very important that you handle and mount your LCD with care. Here are some tips:

- Handle in a static-safe manner
- Do not drop or strike
- Do not attempt to disassemble, repair, or modify
- Do not drill, cut, notch, grind, etc.
- Mount with machine screws in corner holes
- Do not attempt to enlarge mounting holes
- Do not use glue, epoxy, or paint on this unit
- Protect from water, solvents, oils
- Do not bend, warp, or stress
- Install behind a protective transparent window
- Protect from strong electrical fields, ESD
- Protect from reverse-power hookup
